

We utilized the uniqueness of terpenes to isolate the very essence of our cultivars in the form of a High Terpene Full Spectrum Syringe.

HIGH TERPENE SYRINGE | HMK CULTIVAR

Cannabis is an endlessly diverse plant comprised of thousands of different compounds, all of which assist in creating the unique experience that each cultivar delivers. While there are certainly some foundational components, namely the cannabinoids such as THC and CBD, it is the terpenes that play a large role in creating the unique experience that each cultivar delivers. In fact, cannabinoids and terpenes work together in a phenomenon known as the entourage effect.

We have utilized the uniqueness of these terpenes to isolate the very essence of our cultivars in the form of a High Terpene Full Spectrum Syringe. During the extraction process, we are able to isolate these liquid terpenes as the THC-A separates from them. This creates a product full of flavor, which can be used to improve the experience of many other products or used on its own as a smokable concentrate.

This allows patients to mix the High Terpene Syringe into flower, other concentrates, and even pre-rolls. When vaporized on its own, the product produces a moderate high that accentuates the high terpene's effect on the user.

This unique concentrate is sure to open your taste buds to the power of terpenes.

CANNABINOIDS	MASS (%)	MASS (MG/G)
THCa	41.33%	413.3 mg/g
Δ9-THC	4.65%	46.5 mg/g
CBGa	3.98%	39.8 mg/g
